TAMIYA DRIFT SPEC

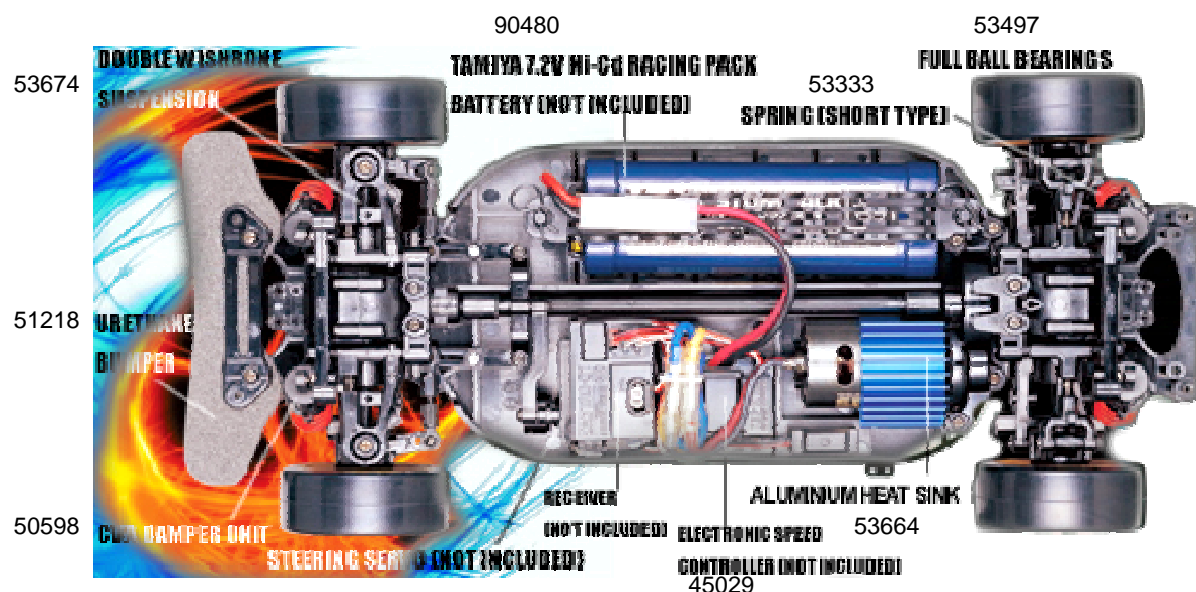

What's Drift Racing?

Drifting is a new style of extreme racing in which the driver forces the rear tires into a slide and moves the car sideways around the track maintaining high speed and control. Gaining in popularity around the world, Tamiya now lets you experience exciting drift action without burning up your real car's tires! This electric R/C assembly kit features full drift specs including drift tires and special suspension settings.

Introducing the TT-01D Drift Spec Chassis

Based on the user-friendly TT-01, this 4WD chassis features lightweight bathtub frame for low center of gravity and optimum balance. Drift spec additions include drift tires, special suspension tunings, full ball bearings, sports-tuned motor, aluminum motor heat sink, CVA mini shock dampers and short springs.

Based on our high quality 1/10 scale assembly kit products, Tamiya's XB models come fully assembled and painted, with all markings pre-applied. All necessary R/C components are pre-installed into chassis including receiver and electronic speed controller (ESC), with easy to use transmitter included. Requires a 7.2volt Nicad & charger. We recommend using our Nicad & charger pack; G16777 = G167 charger + Tamiya 90480 Nicad
